

Preface

The Czech Statistical Office (CZSO) brings out already the twelfth publication in a row focusing on comparison of differences between women and men in various areas of life in modern society. Statistical examination of data classified by sex serves to achieve many goals. Differences between men and women rest not only on physical differences, but they also pose a cultural and social issue – women and men play different roles in life and have different preferences. These differences vary in time and space and many of them may complicate the life of women and men or even discriminate them.

One of basic principles of a democratic state is the requirement to make equal opportunities for all its citizens so that they can accomplish their life aspirations irrespective of whether they are males or females. Statistical data can serve to that in two ways: firstly, as a basis for proposing of relevant measures - as a support for the decision-making of the general government and legislators, and, secondly, as a description and checking of how the principle of equal opportunities of both genders is fulfilled in practice.

By this publication, among others, the CZSO fulfils provision of the paragraph 7.3 of the Government resolution No 456/2001 of 9 May 2001, on “Updating trends in pursuing the policy of equal opportunities for men and women”, by which the Government of the Czech Republic requested the Czech Statistical Office to publish statistical data on women and men periodically.

This year’s publication “Focus on Women, on Men” provides updated statistical data obtained from statistical surveys in the time series usually until the end of the year 2010. The same as in the last year, you can find there the tables presenting international data comparisons in all of the chapters of the publication. Some of them have been changed; some of them are completely new according to data availability.

Besides updating of the time series, also some other changes have been made.

In chapter 1, at outputs for households, the data source has been changed (instead of the LFSS data were taken over from the SILC. These surveys are mutually incomparable.) Some tables have been modified, some have been deleted.

In chapter Health some updated data have not been available, yet; for example, data on expenditure of patients for regulation fees in health by sex and age or data on the average costs of treatment.

Some changes have been made also in Chapter ICT.

*The final part of the publication includes selected information from the results of some sociological researches and surveys on gender issues. There is also selected information from the research of the Office of the Government of the Czech Republic called “**The Trends of Social and Political Mechanism which Influence the Gender Relationship**”; surveyed was the standpoint of women and men regarding the possibility to obtain work corresponding to their qualification and skills depending on age, education and family status of respondents. Further, questions presented applied to the occurrence of domestic violence and attitude of the respondents to that issue.*
