¹ Gross domestic product (GDP) is converted to the previous year prices by deflation of individual groups of products in the framework of supply and use tables.

² Gross domestic income in current prices is identical with GDP, transformation to the previous year prices is calculated by adding up or subtracting gains or losses of exchange rate of foreign trade to the GDP of previous year.

³ Gross national income in previous year prices is calculated by adding up balance of primary income from / to abroad in previous year prices to the gross domestic income in previous year prices. Primary income from / to abroad are recalculated to the previous year prices by the implicit deflator of gross domestic

⁴ Gross disposable income in previous year prices is calculated by adding up balance of current transfers from / to abroad to the gross national income in previous year prices. Current transfers from / to abroad are deflated also by index for gross domestic final expenditure.
